

## **Tracking App Useability Testing**

Scenario: John is a college student that came home for the first time and a few months. No one else is at the home when he gets there and when he opens the door the dog runs out.

### Tasks:

1. Once getting into the app, find the dog's location.
2. After finding the dog's location, post on the community forum to report lost dog
3. Pretend you've found the dog and now set up a boundary for the dog to be aware of when it escapes again.

### What to Change:

1. Navigating to where the boundary set up screen can be confusing, making it easier to find this would be good.
2. The actual process of setting up a boundary needs to be improved as the way it currently functions isn't very user friendly.

### What to Keep:

1. The UI to getting to the map and getting to the community tab were both easy to understand.
2. The map itself was considered to be very effective at showing the information that the user needed to know.
